

6.17 Exam: Area, volume, and density situations

1. Find the area of rectangle $ABCD$ having length $l = 18$ and width $w = 6\frac{1}{4}$. Start with a formula of this form, substituting the given values:

$$A = l \times w$$

2. Find the weight of a volume of water of 23 cubic feet given that the density of water is 62.4 pounds per cubic foot.

$$W = V \times D$$

3. The $\triangle ABC$ is shown below with $A(2, 1)$, $B(7, 1)$, and $C(3, 5)$. The length of the base of the triangle is $AB = 5$.

(a) Write down the height h .

- (b) Find the triangle's area, showing the substitution into the area formula.

$$A = \frac{1}{2}bh$$

4. Find the volume of a pyramid having a square base 4 units on each side, $s = 4$, and a height of $h = 5$. Show the substitution in the volume formula for full credit.

$$V = \frac{1}{3}s^2h$$

5. The American Eagle *silver* coin is minted by the US Treasury. The one ounce coin has a radius of about $r = 20$ millimeters and thickness $h = 3$ mm. Given that the density of silver is $D = 0.0105$ grams per cubic millimeter, find the coin's volume and weight.

Show the substitution into both formulas for full credit.

$$V = \pi r^2 h \text{ and } W = VD$$

6. A parallelogram is shown on the x - y plane having a base $b = 32$, unknown height h , and area $A = 1680$. Find the height.

Show the area formula with substituted values for full credit.

7. Find the population density of Staten Island, New York (Richmond County) in people per square mile.

Population estimate July 1, 2019: 476,143

Land area in square miles: 58.37

Source: US Census ([census.gov](https://www.census.gov))

8. The rectangular prism shown has a volume of $V = 5103$ cubic centimeters. Its base measures $l = 15.75$ centimeters by $w = 12$ cm.

Find its height in centimeters. For credit, begin by writing the volume formula with values substituted.

9. Find the radius of a sphere having a volume of 7791 cubic inches. Round to *the nearest tenth of an inch*. Show the substitution in the volume formula for full credit.

$$V = \frac{4}{3}\pi r^3$$

10. A building wall must be painted. Each gallon of paint covers 250 square feet and costs \$24.50. If the wall measures 130 feet wide by 35 feet tall, how much will the paint cost? (assume that paint must be purchased in gallon cans)
